### Design system enhancements that fit your business needs

Dancik International offers customized application development services through our Product Development Department. This service gives you the ability to acquire system extensions and modifications to the available Dancik software products. Application development services allow enhancements to Dancik Enterprise System and all other Dancik software product offerings to be created, implemented, and maintained. Additionally, these services can be used to create Electronic Data Interchange (EDI) connections, as well as brand new applications and functionality.

### Custom System Enhancements

Acquire custom-tailored programming services to meet your critical system and business requirements. To ensure the delivery of quality custom programs, our experts will work with you through the entire development phase, including:

- **Design**

In the design phase, you will work with Dancik business analysts to define the specific enhancement requirements. Our goal is to meet your requirements while also designing a solution that maximizes its integration into the Dancik system.

- **Programming**

All custom programming is done in-house by senior analysts. These experienced professionals are well versed in the entire Dancik suite of products and in the flooring industry. Our developers work closely with our business analysts during all phases of development to ensure that the design integrity and your requirements are met.

- **Quality Control**

Quality Control is a multi-phase process at Dancik International that encompasses the entire programming life cycle. This process includes, but is not limited to, reviews of the functional and technical design requirements, as well as unit, integration, and system regression testing. The testing includes beta testing at your site during the initial deployment phase. The business analysts and developers who originally worked on the project are available for questions or issues that arise during the field beta test phase.

- **Documentation**

Documentation is included early in the software development life cycle. Our technical writer will operate the new modules, document the features, and create examples. This process continues until final acceptance by your company and our Quality Assurance Department.

### Major Benefits:

- Providing added functionality that is unique yet necessary for your business model.
- Integrating features into existing software seamlessly without requiring further system manipulation or redevelopment throughout all future updates and releases.
- Influencing direction of Dancik software development and best practices.
